Tender Overview

Outline

- Motivation
 - Challenges in Efficient LLM Inference
 - Limitations of Prior Works
- **Tender: Algorithm-Hardware Co-design for Efficient LLM Inference**
 - Tensor Decomposition
 - Rescaling Operation
- Evaluation
- Conclusion

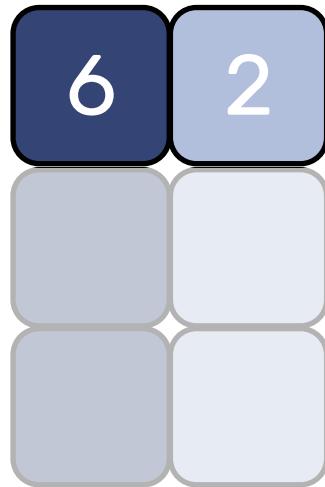

Key Insight

$$\begin{matrix} S_1 & S_2 \\ \begin{matrix} 6 & 2 \\ \times & \end{matrix} \\ \begin{matrix} 1 \\ 3 \end{matrix} \end{matrix} = \begin{matrix} 6 \\ + \\ 6 \end{matrix}$$

Activation Weight

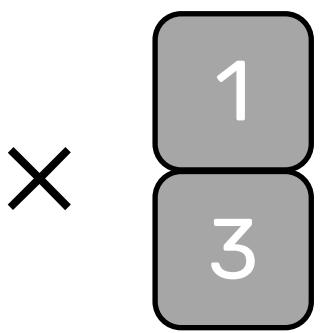

Key Insight

$$S_1 = 2S_2 \quad S_2$$

Activation

$$S_w = 1.0$$

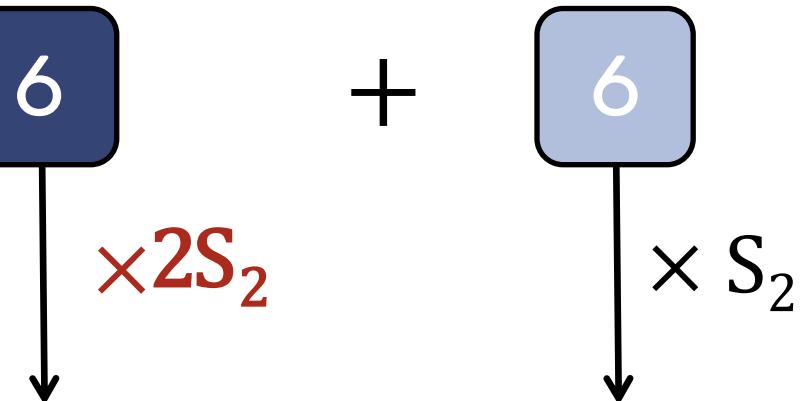

Weight

\times

=

$$\times 2S_2$$

Dequantize?

Key Insight

$$S_1 = 2S_2 \quad S_2$$

Activation

The activation matrix is a 3x2 grid. The top row contains two squares: the left one is dark blue with value 6, and the right one is light blue with value 2. The middle row contains two empty light gray squares. The bottom row contains two empty light gray squares.

$$S_w = 1.0 \quad \times \quad \begin{matrix} 1 \\ 3 \end{matrix} \quad = \quad \begin{matrix} 6 \\ \times S_2 \end{matrix} + \begin{matrix} 6 \\ \times S_2 \end{matrix}$$

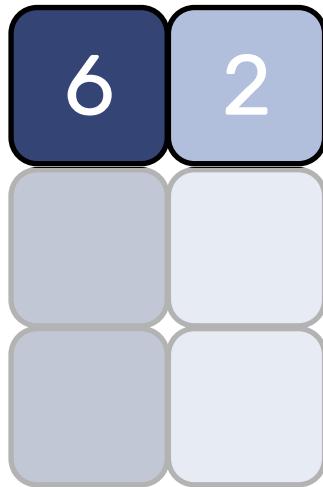

Rescaling

The weight matrix is a 2x1 column vector with values 1 and 3, both in gray squares.

The result of the multiplication is shown as two terms: $6 \times S_2$ and $6 \times S_2$. Arrows point from the weight matrix to each term. A box labeled "Same Scale Factor" encloses both terms.

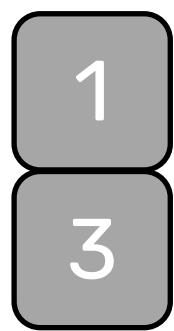

Key Insight

$$S_1 = 2S_2 \quad S_2$$

Activation

$$S_w = 1.0$$

Weight

Rescaling

$$= \begin{matrix} 6 \\ \times 2 \end{matrix} + \begin{matrix} 6 \end{matrix}$$

$$= \begin{matrix} 12 \end{matrix} + \begin{matrix} 6 \end{matrix}$$

$$= \begin{matrix} 18 \end{matrix}$$

Key Insight

$$S_1 = 2S_2 \quad S_2 \quad S_w = 1.0 \quad \text{Rescaling}$$
$$= 6 \times 2 + 6$$

The ratio between scale factors is an integer
→ Enables computing in integer pipeline

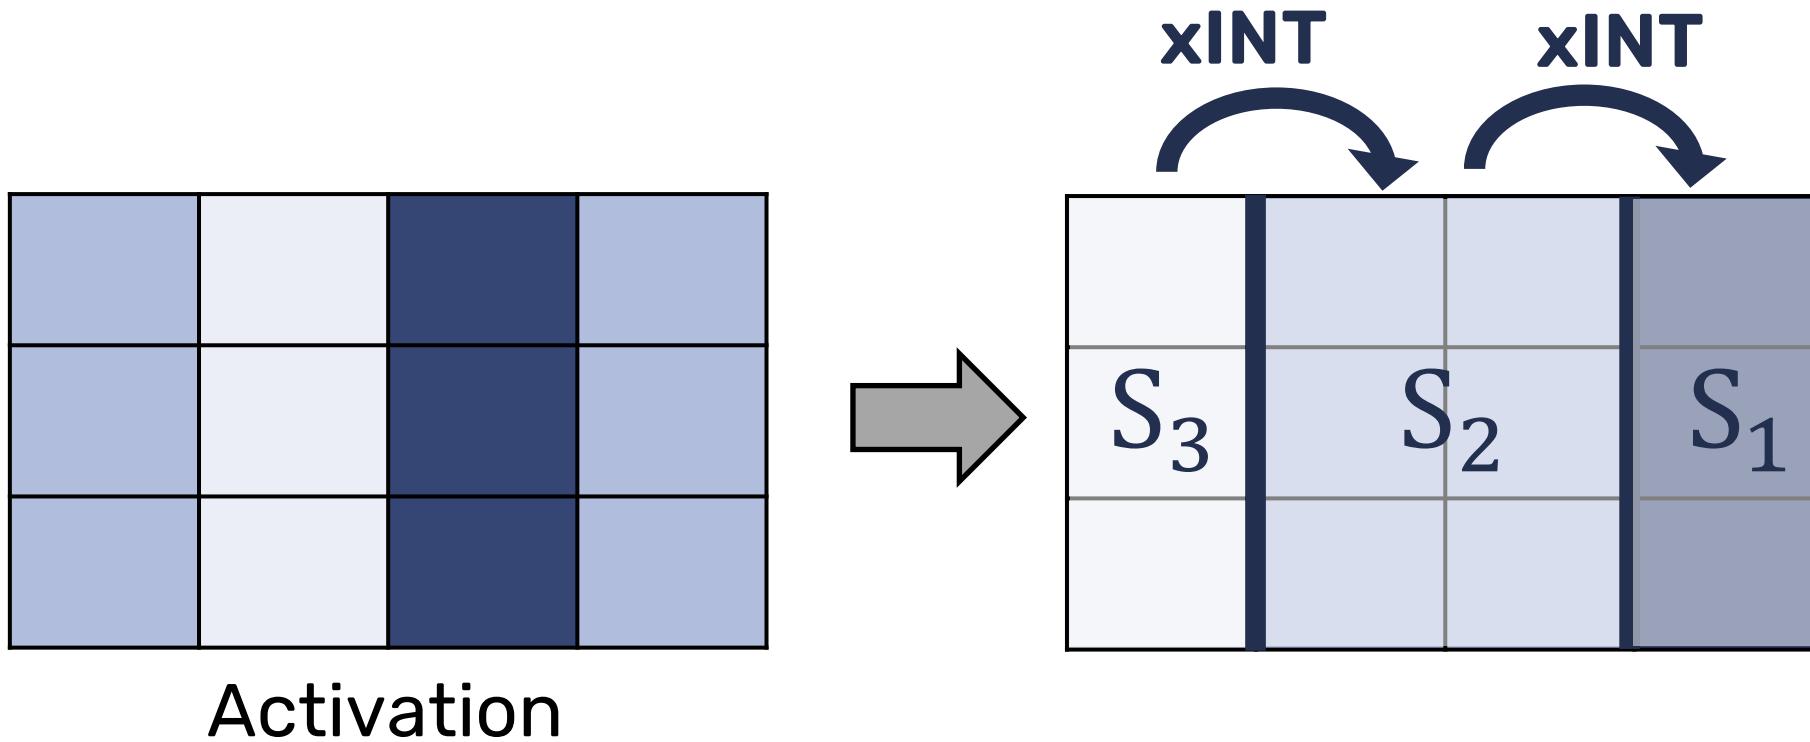

Activation

Weight

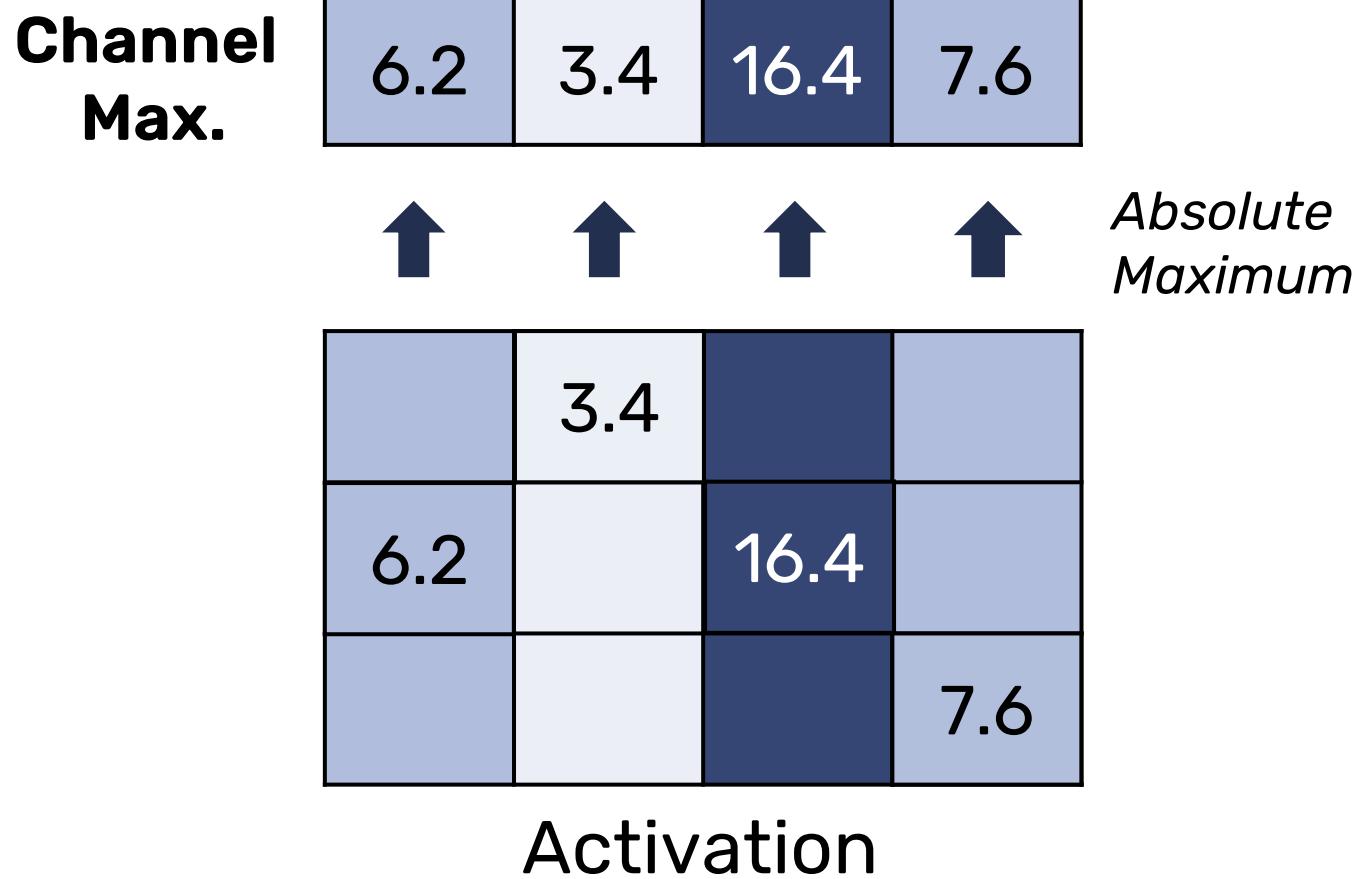

Scale Factor

$$= 18$$

Conclusion

Problem

- Outliers make an efficient serving of LLM challenging
- Complex and intrusive design of prior works

Solution: Tender, efficient low-bit integer-based LLM inference accelerator

- Tensor decomposition while considering accuracy and performance
- Rescaling only requires a 1-bit shifter and 1-cycle latency

Result

- Tender achieves up to an average of **2.6x speedup** over the baseline with **substantially higher accuracy** ☺

Thank You!

Tender

Accelerating Large Language
Models via **Tensor Decomposition**
And **Runtime Requantization**
